

1. (KR) Consider two hosts, A and B, connected by a single link of rate  $R$  bps. Suppose that the two hosts are separated by  $m$  meters, and suppose the propagation speed along the link is  $s$  meters/sec. Host A is to send a packet of size  $L$  bits to Host B.
  - (a) Express the propagation delay,  $d_{\text{prop}}$  in terms of  $m$  and  $s$ .
  - (b) Determine the transmission time of the packet,  $d_{\text{trans}}$ , in terms of  $L$  and  $R$ .
  - (c) Ignoring processing and queueing delays, obtain an expression for the end-to-end delay.
  - (d) Suppose Host A begins to transmit the packet at time  $t = 0$ . At time  $t = d_{\text{trans}}$ , where is the last bit of the packet?
  - (e) Suppose  $d_{\text{prop}}$  is greater than  $d_{\text{trans}}$ . At the time  $t = d_{\text{trans}}$ , where is the first bit of the packet?
  - (f) Suppose  $d_{\text{prop}}$  is less than  $d_{\text{trans}}$ . At the time  $t = d_{\text{trans}}$ , where is the first bit of the packet?
  - (g) Suppose  $s = 2.4 \cdot 10^8$ ,  $L = 1500$  bits, and  $R = 512$  kbps. Find the distance  $m$  so that  $d_{\text{prop}} = d_{\text{trans}}$ .
2. (KR) Suppose two hosts, A and B, are separated by 15,000 kilometers and are connected by a direct link of  $R = 2.5$  Mbps. Suppose the propagation speed over the link is  $2.2 \cdot 10^8$  meters/s.
  - (a) Calculate the bandwidth delay product,  $R \cdot d_{\text{prop}}$ .
  - (b) Consider sending a file of 1,500,000 bits from Host A to Host B. Suppose the file is sent continuously as one large message. What is the maximum number of bits that will be in the link at any given time?
  - (c) Provide an interpretation of the bandwidth delay product.
  - (d) What is the width (in meters) of a bit in the link?
  - (e) Derive a general expression for the width of a bit in terms of the propagation speed  $s$ , the transmission rate  $R$ , and the length of the link  $m$ .
  - (f) If we can modify  $R$ , for what value of  $R$  is the width of a bit as long as the length of the link?
3. (KR) Consider queueing delay in a router buffer (preceding an outbound link). Suppose all packets are  $L$  bits, the transmission rate is  $R$  bps, and that  $N$  packets simultaneously arrive at the buffer every  $LN/R$  seconds.
  - (a) Find the average queueing delay of a packet. (Hint: The queueing delay for the first packet is zero; for the second packet,  $L/R$ ; for the third packet  $2L/R$ . The  $N$ th packet has already been transmitted when the second batch of packets arrives.)
4. (KR) Suppose users share a 4 Mbps link. Also suppose each user requires 100 kbps when transmitting, but each user transmits only 10 percent of the time.
  - (a) When circuit switching is used, how many users can be supported?
  - (b) For the remainder of this problem, suppose packet switching is used. Find the probability that a given user is transmitting.
  - (c) Suppose there are 40 users. Find the probability that at any given time, exactly  $n$  users are transmitting simultaneously. (Hint: Use the binomial distribution.)
  - (d) Find the probability that there are 15 or more users transmitting simultaneously.
5. (KR) Consider a case of statistical multiplexing where users are generating data at a rate of 100 kbps when busy, but are busy generating data only with probability  $p = 0.2$ . Suppose the link is a 2 Gbps link.
  - (a) What is  $N$ , the maximum number of users that can be supported simultaneously under circuit switching?
  - (b) Now consider packet switching and a user population of  $M$  users. Give a formula (in terms of  $p, M, N$ ) for the probability that more than  $N$  users are sending data.

6. (KR) Consider a packet of length  $L$  which begins at end system A, travels over one link to a packet switch (store and forward), and travels from the packet switch over a second link to a second packet switch and finally over a third link to the destination end system. Let  $D_i$ ,  $s_i$ , and  $R_i$  denote the length, propagation speed, and the transmission rate of link  $i$ , for  $i = 1, 2, 3$ . The packet switches delay each packet by  $L/R_i$ .
  - (a) Assuming no queueing delays, in terms of  $D_i$ ,  $s_i$ , and  $R_i$  ( $i = 1, 2, 3$ ), and  $L$ , what is the total end-to-end delay of the packet?
  - (b) Suppose the length of a message is 4 packets. Each packet is 1,500 bytes, the propagation speed on all links is  $2.5 \cdot 10^8$  m/s, the transmission rates of all links is 1Mbps, the packet switch processing delay is 1 msec, the length of the first link is 5,000 km, and the length of the last two links is 1,000 km. For these values what is the end-to-end delay?
  - (c) Suppose the data rate of the last link is 2 Mbps, what is the end-to-end delay?
  - (d) Suppose the data rate of the first link is 2 Mbps and on the other links it is 1 Mbps, what is the end-to-end delay?
7. (PD) Suppose a 1-Gbps point-to-point link is being set up between the Earth and a new lunar colony. The distance from the moon to the Earth is approximately 385,000 km, and data travels over the link at the speed of light  $-3 \times 10^8$  m/s.
  - (a) Calculate the minimum RTT for the link. Using the RTT as the delay, calculate the delay  $\times$  bandwidth product for the link.
  - (b) A camera on the lunar base takes pictures of the Earth and saves them in digital format to a disk. Suppose Mission Control on Earth wishes to download the most current image, which is 25MB. What is the minimum amount of time that will elapse between when the request for data goes out and the transfer is finished?
8. (PD) Calculate the effective bandwidth for the following cases. For (a) and (b) assume there is a steady supply for data to send; for (c) calculate the average over 12 hours.
  - (a) 12,000 byte packets over 100Mbps Ethernet through three store-and-forward switches. Switches can send on one link while receiving on the other.
  - (b) Same as (a) but with the sender having to wait for a 50-byte acknowledgement packet after sending each 12,000-bit data packet.
  - (c) Overnight (12-hour) shipment of 100 DVDs that hold 4.7 GB each.
9. (PD) Calculate the delay  $\times$  bandwidth product for the following links. Use one-way delay, measured from first bit sent to first bit received.
  - (a) 100-Mbps Ethernet with a delay of 10  $\mu$ s.
  - (b) 100-Mbps Ethernet with a single store-and-forward switch, packet size of 12,000 bits and 10 $\mu$ s per link propagation delay.
  - (c) 1.5-Mbps T1 link, with a transcontinental one-way delay of 50ms.
  - (d) 1.5-Mbps T1 link between two ground stations communicating via satellite in geosynchronous orbit 35900 km high. The only delay is speed of light propagation delay from Earth to the satellite and back.
10. (PD) Suppose that a certain communications protocol involves a per-packet overhead of 50 bytes for headers and framing. We send 1 million bytes of data using this protocol; however, one data byte is corrupted and the entire packet containing it is thus lost. Give the total number of overhead + loss bytes for packet data sizes of 1000, 10,000, and 20,000 bytes. Which size is optimal?
11. (PD) For the following, assume that no data compression is done, although in practice this would almost never be the case. For (a) to (c), calculate the bandwidth necessary for transmitting in real time.
  - (a) Video at a resolution of  $640 \times 480$ , 3 bytes/pixel, 30 frames a second.
  - (b) Video at a resolution of  $160 \times 120$ , 1 byte/pixel, 5 frames a second.

- (c) CD-ROM music, assuming one CD holds 75 minutes' worth and takes 650 MB.
  - (d) Assume a fax transmits an  $8 \times 10$ -inch black-and-white image at a resolution of 72 pixels per inch. How long would it take over a 14.4-kbps modem?
12. (PD) Discuss the relative performance needs of the following applications in terms of average bandwidth, peak bandwidth, latency, jitter, and loss tolerance:
- (a) File server.
  - (b) Print server.
  - (c) Digital library.
  - (d) Routine monitoring of remote weather instruments.
  - (e) Voice.
  - (f) Video monitoring of a waiting room.
  - (g) Television broadcasting.
